

denture

Fixed denture

Removable denture

Implant denture

removable partial denture (可摘局部义齿) complete denture (全口义齿) over denture (覆盖义齿)

immediate denture(即刻义齿)

a good pair of denture improves patient's quality of life an unsuitable pair of denture makes patients feel uncomfortable, also does harms to their oral health

Future dentist learn oral physiology well

口腔解剖生理学

主 审 皮 昕 主 编 王美青 副主编 何三纲

1, jaw position

intercuspal position(ICP)
retruded contact position(RCP)
mandibular postural position(MPP)

vertical distance is measured too short (the MMP is abnormal)

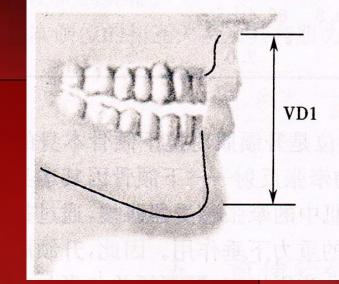

*the attrition(磨损) of teeth

*give much more load to the teeth, periodontium(牙周组织) and the TMJ.

the dysfunction of stomatognathic system(口颌系统)

2 occlusion

Fabricating (制作) dentures making an impression and a wax bite to determine vertical dimensions of occlusion

If dentists haven't got a proper occlusion, the dentures will not be properly made. Then patients will feel painful, and even the incisive papillae (切牙乳头) will be pressed, leading to a severe headache.

3 lateral occlusal relations

canine protected occlusion group functional occlusion

Natural dentitions: no contact in nonworking side Complete denture: balanced occlusion

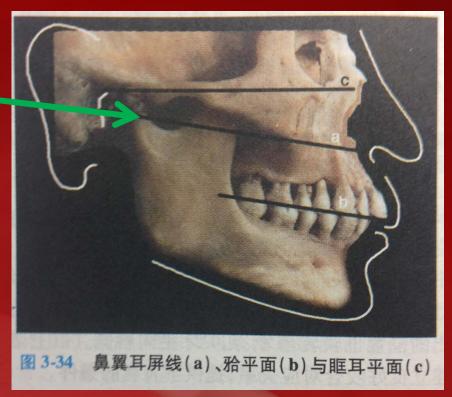

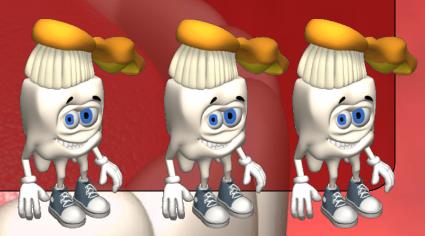

4. Surface landmarks

Camper's plane: (鼻翼耳屏线)

a plane passing from the acanthion to the center of each bony external auditory meatus.

It is often used as a reference plane when teeth are lost.

5 mastication

- *the masticatory efficiency: still can't compare with the natural teeth (not eat something too hard)
- *wearing dentures: bite bilaterally and simultaneously(双侧同时)
- *normal people: bite bilaterally and alternately(双侧交替)
- *the periodontal potential (牙周潜力): the basic in designing dentures. It is used to afford the biting force suffered by dentures.

6 improve patients' appearance and pronunciation

- 1. give a natural appearance to the face
- 2 provide support for the lips and cheeks
- 3. speak better

7. reactions after wearing dentures A. more saliva

wear dentures

the brain senses the appliance and interprets it as 'food'

sending messages to the salivary glands to produce more saliva and to secrete it at a higher rate

after 12~24 hours

return to normal output.

7 reactions after wearing dentures

B Gagging(恶心)

*The denture is too loose, too thick or extended too far posteriorly onto the soft palate.

*psychological denial(拒绝) of the denture.

C gingivitis (牙龈炎)

caused by the accumulation of dental plaque.

7 reactions after wearing dentures

D loss of taste sensations

taste papillae located on

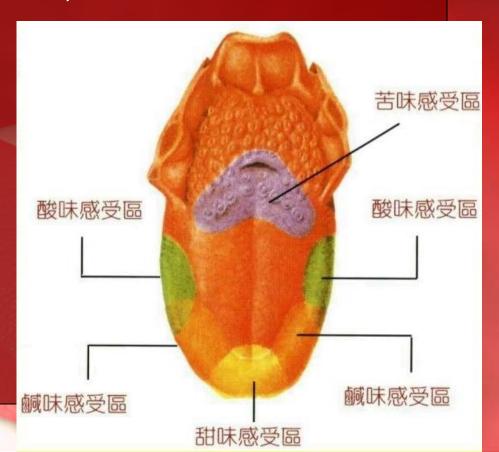

tongue

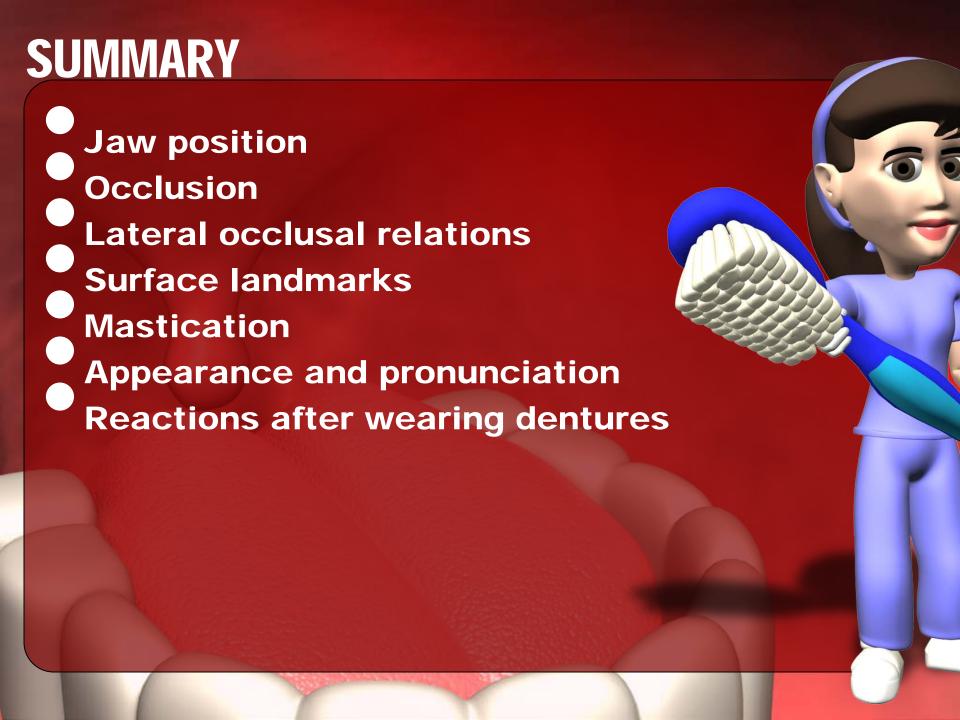

soft and hard palate(软、硬腭)

pharynx (咽)

epiglottis (会厌)

larynx(喉)

For dentists, to make a suitable pair of denture for patient, we are responsible to have a good command of oral physiology.

For patients, we are supposed to protect our teeth from now on.

Wish all the people benefited from oral health in the future

Thank you for your liesteng

Thank you for standing my poor oral English for so long!!!
